#### Abstract

In this paper, fixed points three nonlinear operators are investigated. Common fixed point theorems are established in a complete $G_{b}$-metric space. The result presented in this paper improves the corresponding results in [1].

Keywords: $G$-metric space; $b$-metric space; Common fixed point.
2010 AMS Subject Classification: 47 H 10 .

## 1. Main results

In [1], Roshan et al. obtained a common fixed point theorem in a complete $G_{b}$-metric space. After carefully reading the paper, the authors find that the proof of $d_{n+1} \leq d_{n}$ in Theorem 2.1 [1] turned out to be not comprehensive. They only proved $d_{3 n+1} \leq d_{3 n}$ and $d_{3 n+2} \leq d_{3 n+1}$ and declared that $d_{n+1} \leq d_{n}$, which has a skip.

Next, we give a new proof.

Theorem 1.1 Let $(X, G)$ be a complete $G_{b}$-metric space. Let $A, B, C: X \rightarrow X$ be mappings which satisfy the following condition:

$$
\begin{equation*}
\psi\left(2 s^{4} G(A x, B y, C z)\right) \leq \psi(M(x, y, z))-\varphi(M(x, y, z)) \tag{1.1}
\end{equation*}
$$

for all $x, y, z \in X$, where $\psi, \varphi:[0, \infty) \rightarrow[0, \infty)$ are two mappings such that $\psi$ is continuous nondecreasing, $\varphi$ is a lower semi-continuous function with $\psi(t)=\varphi(t)=0$ if and only if $t=0$ and

$$
M(x, y, z)=\max \{G(x, y, z), G(x, A x, B y), G(y, B y, C z), G(z, C z, A x)\}
$$

Then, either one of $A, B$, and $C$ has a fixed point, or, the maps $A, B$ and $C$ have a unique common fixed point.

Proof. Choose $x_{0} \in X$. Define the sequence $\left\{x_{n}\right\}$ as $x_{3 n+1}=A x_{3 n}, x_{3 n+2}=B x_{3 n+1}$ and $x_{3 n+3}=$ $C x_{3 n+2}$ for all $n=0,1,2, \ldots$. If $x_{3 n}=x_{3 n+1}$, then $x_{3 n}$ is a fixed point of $A$. If $x_{3 n+1}=x_{3 n+2}$, then $x_{3 n+1}$ is a fixed point of $B$. If $x_{3 n+2}=x_{3 n+3}$, then $x_{3 n+2}$ is a fixed point of $C$. Now, assume that $x_{n} \neq x_{n+1}$ for all $n$. Let $d_{n}=G\left(x_{n}, x_{n+1}, x_{n+2}\right)$. we obtain from (1.1) that

$$
\begin{aligned}
\psi\left(d_{3 n+1}\right) & \leq \psi\left(2 s^{4} d_{3 n+1}\right)=\psi\left(2 s^{4} G\left(x_{3 n+1}, x_{3 n+2}, x_{3 n+3}\right)\right) \\
& =\psi\left(2 s^{4} G\left(A x_{3 n}, B x_{3 n+1}, C x_{3 n+2}\right)\right) \\
& \leq \psi\left(M\left(x_{3 n}, x_{3 n+1}, x_{3 n+2}\right)\right)-\varphi\left(M\left(x_{3 n}, x_{3 n+1}, x_{3 n+2}\right)\right)
\end{aligned}
$$

where

$$
\begin{aligned}
M\left(x_{3 n}, x_{3 n+1}, x_{3 n+2}\right)= & \max \left\{G\left(x_{3 n}, x_{3 n+1}, x_{3 n+2}\right), G\left(x_{3 n}, A x_{3 n}, B x_{3 n+1}\right),\right. \\
& \left.G\left(x_{3 n+1}, B x_{3 n+1}, C x_{3 n+2}\right), G\left(x_{3 n+2}, C x_{3 n+2}, A x_{3 n}\right)\right\} \\
= & \max \left\{G\left(x_{3 n}, x_{3 n+1}, x_{3 n+2}\right), G\left(x_{3 n}, x_{3 n+1}, x_{3 n+2}\right),\right. \\
& \left.G\left(x_{3 n+1}, x_{3 n+2}, x_{3 n+3}\right), G\left(x_{3 n+2}, x_{3 n+3}, x_{3 n+1}\right)\right\} \\
= & \max \left\{d_{3 n}, d_{3 n}, d_{3 n+1}, d_{3 n+1}\right\} \\
= & \max \left\{d_{3 n}, d_{3 n+1}\right\} .
\end{aligned}
$$

We prove that $d_{3 n+1} \leq d_{3 n}$ for each $n \in \mathbb{N}$. If $d_{3 n+1}>d_{3 n}$ for some $n \in \mathbb{N}$, then we have $\psi\left(d_{3 n+1}\right) \leq \psi\left(d_{3 n+1}\right)-\varphi\left(d_{3 n+1}\right)$, which implies that $d_{3 n+1}=0$, a contradiction to $d_{3 n+1}>0$. Also, we have

$$
\begin{aligned}
\psi\left(d_{3 n+2}\right) & \leq \psi\left(2 s^{4} d_{3 n+2}\right)=\psi\left(2 s^{4} G\left(x_{3 n+2}, x_{3 n+3}, x_{3 n+4}\right)\right) \\
& =\psi\left(2 s^{4} G\left(B x_{3 n+1}, C x_{3 n+2}, A x_{3 n+3}\right)\right) \\
& =\psi\left(2 s^{4} G\left(A x_{3 n+3}, B x_{3 n+1}, C x_{3 n+2}\right)\right) \\
& \leq \psi\left(M\left(x_{3 n+3}, x_{3 n+1}, x_{3 n+2}\right)\right)-\varphi\left(M\left(x_{3 n+3}, x_{3 n+1}, x_{3 n+2}\right)\right)
\end{aligned}
$$

where

$$
\begin{aligned}
M\left(x_{3 n+3}, x_{3 n+1}, x_{3 n+2}\right)= & \max \left\{G\left(x_{3 n+3}, x_{3 n+1}, x_{3 n+2}\right), G\left(x_{3 n+3}, A x_{3 n+3}, B x_{3 n+1}\right),\right. \\
& \left.G\left(x_{3 n+1}, B x_{3 n+1}, C x_{3 n+2}\right), G\left(x_{3 n+2}, C x_{3 n+2}, A x_{3 n+3}\right)\right\} \\
= & \max \left\{G\left(x_{3 n+3}, x_{3 n+1}, x_{3 n+2}\right), G\left(x_{3 n+3}, x_{3 n+4}, x_{3 n+2}\right)\right. \\
& \left.G\left(x_{3 n+1}, x_{3 n+2}, x_{3 n+3}\right), G\left(x_{3 n+2}, x_{3 n+3}, x_{3 n+4}\right)\right\} \\
= & \max \left\{d_{3 n+1}, d_{3 n+2}, d_{3 n+1}, d_{3 n+2}\right\} \\
= & \max \left\{d_{3 n+1}, d_{3 n+2}\right\}
\end{aligned}
$$

Similarly, if $d_{3 n+2}>d_{3 n+1}$ for some $n \in \mathbb{N}$, then we have $\psi\left(d_{3 n+2}\right) \leq \psi\left(d_{3 n+2}\right)-\varphi\left(d_{3 n+2}\right)$, which implies that $d_{3 n+2}=0$, a contradiction to $d_{3 n+2}>0$. Also, we have

$$
\begin{aligned}
\psi\left(d_{3 n+3}\right) & \leq \psi\left(2 s^{4} d_{3 n+3}\right)=\psi\left(2 s^{4} G\left(x_{3 n+3}, x_{3 n+4}, x_{3 n+5}\right)\right) \\
& =\psi\left(2 s^{4} G\left(C x_{3 n+2}, A x_{3 n+3}, B x_{3 n+4}\right)\right) \\
& =\psi\left(2 s^{4} G\left(A x_{3 n+3}, B x_{3 n+4}, C x_{3 n+2}\right)\right) \\
& \leq \psi\left(M\left(x_{3 n+3}, x_{3 n+4}, x_{3 n+2}\right)\right)-\varphi\left(M\left(x_{3 n+3}, x_{3 n+4}, x_{3 n+2}\right)\right)
\end{aligned}
$$

where

$$
\begin{aligned}
M\left(x_{3 n+3}, x_{3 n+4}, x_{3 n+2}\right)= & \max \left\{G\left(x_{3 n+3}, x_{3 n+4}, x_{3 n+2}\right), G\left(x_{3 n+3}, A x_{3 n+3}, B x_{3 n+4}\right),\right. \\
& \left.G\left(x_{3 n+4}, B x_{3 n+4}, C x_{3 n+2}\right), G\left(x_{3 n+2}, C x_{3 n+2}, A x_{3 n+3}\right)\right\} \\
= & \max \left\{G\left(x_{3 n+3}, x_{3 n+4}, x_{3 n+2}\right), G\left(x_{3 n+3}, x_{3 n+4}, x_{3 n+5}\right),\right. \\
& \left.G\left(x_{3 n+4}, x_{3 n+5}, x_{3 n+3}\right), G\left(x_{3 n+2}, x_{3 n+3}, x_{3 n+4}\right)\right\} \\
= & \max \left\{d_{3 n+2}, d_{3 n+3}, d_{3 n+3}, d_{3 n+2}\right\} \\
= & \max \left\{d_{3 n+2}, d_{3 n+3}\right\} .
\end{aligned}
$$

Similarly, if $d_{3 n+3}>d_{3 n+2}$ for some $n \in \mathbb{N}$, then we have $\psi\left(d_{3 n+3}\right) \leq \psi\left(d_{3 n+3}\right)-\varphi\left(d_{3 n+3}\right)$, which implies that $d_{3 n+3}=0$, a contradiction to $d_{3 n+3}>0$. Hence, we have $0<d_{n+1} \leq d_{n}$ for each $n \in \mathbb{N}$. The rest proof process is the same with which was given in [1]. We, therefore, omit the proof.

## Conflict of Interests

The authors declare that there is no conflict of interests.
