#### Abstract

This research deals with the problem of four-dimensional transportation in the General Company for Food Stuff Trading because of its great role in managing the transportation process. The transportation problem of the fourdimensional of the different demand centers, the different supply centers, the distribution line, and the various means of transportation was solved using the particle swarm optimization algorithm using the coding formula via the MATLAB program. The goal of choosing a particle swarm optimization algorithm is computationally inexpensive, in addition, it is an effective method for many optimization problems and to find the best solution among a huge number of possible solutions.

Key words: 4D transportation; particle swarm optimization.
2010 AMS Subject Classification: 90C08, 90B06, 68T20.

## 1. INTRODUCTION

Operations research has achieved great success as it is one of the most important applied sciences in the military and civil fields, as it aims to help decision makers in choosing the right decision,

[^0]and is used in for solving and addressing transportation, production, warehousing and allocation problems in order to reach the optimal decision represented by the greatest profits, least costs and least times [13].

The transportation problem is one of the most important problems that studies all matters related to the transportation of goods, raw materials, people...etc., from their locations to the requesting parties. This process increases transportation costs, so it requires building a mathematical model that reduces transportation costs using special optimal solutions methods. The classical transportation model, called (homogeneous) model, considers only one mode of transportation and homogeneous commodity [8].

In real life, either the transportation process requires a planning study to transfer a group of nonhomogeneous products from supply sources to demand stations at variable costs, or the means of transportation are heterogeneous, which may be land, sea or air, and this has increased the complexity of the mathematical model of the transportation problem. The three-dimensional model indicates that the mode of transportation is different or the type of goods transported is different [1].

Usually, road distances between sources and requesting parties are not taken into account in transportation problems, but in reality routes vary between sources and requesting parties, transportation costs per unit and fixed fees are no longer the same. Some paths may be smooth and in good condition while others may be uneven, not all types of vehicles may travel along each path. Therefore, the choice of roads plays a major role in the transportation problem, and therefore if the different paths are considered along with the different means of transportation, the threedimensional transportation problem is transformed into a four-dimensional transportation problem [4]. There are several criteria for making the best decision to adopt an efficient transportation model that is known for finding realistic solutions to a transportation problem that contains various different resources or requirements to multiple places requesting these requirements by different means of transportation to achieve a number of goals, for example, cost and time ... etc, [2].

The paper is organised as follows: In section 2, a mathematical formulation of the four-dimensional transportation problem will be presented. Section 3 gives a brief description of the Particle Swarm
optimization metaheuristic. In section 4 a real case problem will be solved by the PSO metaheuristic. Section 5 concludes the paper and gives some perspectives.

## 2. Sports Model of the Four-Dimensional Transportation Problem

The formula of the mathematical model is as follows: [Anderson et al. ,1997; Bakhayt, 2016; Bera, et al. 2018, Halder Jana et al. 2019, Sahoo et al. 2020]

$$
\begin{equation*}
\text { Min } \quad Z=\sum_{i=1}^{m} \sum_{j=1}^{n} \sum_{k=1}^{p} \sum_{q=1}^{d} \mathrm{C}_{i, j, k, q} * \mathrm{X}_{i, j, k, q} \tag{1-1}
\end{equation*}
$$

As for the restrictions, they include the registration of the various means of transport and the registration of the various supply and demand centers, in addition to the transport of various materials.
S.t:

$$
\begin{align*}
& \sum_{q=1}^{d} \sum_{j=1}^{n} \sum_{k=1}^{p} X_{i, j, k, q}=a(i) \quad \forall i=1, \ldots, m  \tag{1-2}\\
& \sum_{i=1}^{m} \sum_{k=1}^{p} \sum_{q=1}^{d} \mathrm{X}_{i, j, k, q}=b(j) \quad \forall j=1, \ldots, n  \tag{1-3}\\
& \sum_{i=1}^{m} \sum_{j=1}^{n} \sum_{k=1}^{p} \mathrm{X}_{i, j, k, q}=d(q) \quad \forall q=1, \ldots, d  \tag{1-4}\\
& \sum_{i=1}^{m} \sum_{j=1}^{n} \sum_{q=1}^{d} \mathrm{X}_{i, j, k, q}=L(k) \quad \forall k=1, \ldots, p  \tag{1-5}\\
& \sum_{i=1}^{m} a(i)=\sum_{j=1}^{n} b(j)=\sum_{q=1}^{d} d(q)  \tag{1-6}\\
& \mathrm{X}_{i, j, k, q} \geq 0 \tag{1-7}
\end{align*}
$$

knowing that:
$m$ : The number of display sources

$$
\begin{gathered}
(i=1,2, \ldots, m) \\
(j=1,2, \ldots, n) \\
(k=1,2, \ldots, p)
\end{gathered}
$$

$n$ : Number of demand centers
$p$ : The number of types of materials
$d$ : The number of different types and modes of transportation $\quad(q=1,2, \ldots, d)$
$X_{i, j, k, q}$ : Quantity of materials transported of commodity of type ( $k$ ) from source ( $i$ ) to demand center ( $j$ ) Transfer of type ( $q$ ).
$C_{i, j, k, q}$ : The cost of transporting one unit of materials $(k)$ from the source $(i)$ to the demand center (j) with transportation of type (q).
$T_{i, j, k, q}$ : Time to transfer one unit of material $(k)$ from source $(i)$ to demand center $(j)$ with transfer type ( $q$ ).
$a(i)$ : The amount of material available in the source (supply) ( $i$ ).
$b(j)$ : Quantity of materials needed by the order center $(j)$.
$d(q)$ : The capacity of the transport medium (q) used in the transport process.
$L_{(K)}$ : The number of various materials in the supply sources $(k)$.
Equation (1-2) indicates that the sum of the quantities transported from different sources (supply) for each type of different materials is equal to the equipment available in these sources.

Equation (1-3) indicates that the total quantities transferred from different sources (supply) to the different requesting parties must meet the needs of these requests and for each of the different types of materials.

Equation (1-4) indicates that the total quantities transported from different sources (supply) must be transferred to the different requesting parties by means of transport appropriate for the type of different materials.

Equation (1-5) indicates that the sum of the quantities transferred from different sources (supply) to the different requesting parties is equal to the total quantities of all different types of materials. Equation (1-6) indicates that the quantities of the various commodities received from all the different demand sides are equal to the quantities of commodities supplied from all different sources and the total quantities of the various commodities supplied from all the different sources. Equation (1-7) indicates a non-negative constraint whose value must be equal to or greater than zero.

This model is difficult to solve exactly in an acceptable time, so we proposed to solve it by an approximate method: the metaheuristic Particle Swarm optimization.

## 3. The Particle Swarm Optimization (PSO)

An adaptive algorithm, proposed in 1998 by J.Kennedy, adapts a group of individuals by randomly returning to previously successful areas of the search space [9]. The Particle Swarm Optimization Algorithm is a population-based search algorithm based on simulating social behavior of birds. Within the herd, which is the modernization of the society of individuals by applying a type of operator according to the efficiency of the information obtained from the environment it is possible to expect the movement of individuals from the population towards areas of better solutions [10] Each individual flies in the search space with a speed that is dynamically adjusted according to their own and accompanying flight experience, each individual being a point in the dimensional search space D [6].

In general, it contains three basic aspects, the first represents the individual best, where each individual compares his position to his best position i.e. no information from other particles is used, the second is the convergence problem, either the third is to drive the movement of the particles the location of the best particle of the entire swarm [13].

Pseudo code for PSO Algorithm [13] [ 4]
Input
m : number of supplier centers
n : number of demand centers
p: number of items
d: number of vehicles
$\mathrm{a}(\mathrm{q})$ : quantities of items available in the supplier centers q
$b(i)$ : demand of items in demand center i
$\mathrm{L}(\mathrm{k})$ : the amount of diverse items in the supplier centers $k$
$d(j)$ : the capacity of vehicle $j$
$C_{i, j, q, k}$ :cost of transportation $\forall q=1, \ldots, m i=1, \ldots, n \quad k=1, \ldots, p \quad j=1, \ldots d$

## Output

$V(i|j| q \mid k)$ : best particle for 4transportation
Step1: for each particle:
Initialize particle
Step2: do:
a) for each particle:

1) insert particle in decoding procedure
2) calculate fitness value
3) if the fitness value is better than the best fitness value (pBest) in history
4) set current value as the new pBest

End
b) for each particle:

1) find in the particle neighborhood, the particle with the best fitness
2) calculate particle velocity according to the velocity
3) Apply the velocity constriction
4) Update particle position according to the position
5) Apply the position constriction

End
While maximum iterations or minimum

## Application of PSO to a real case problem

The data were obtained from the General Company for Food Stuff Trading for the different demand centers (8), the different supply centers (8), the distribution line (2), and the various means of transportation (4).

The use of artificial intelligence algorithms in complex and large-scale problems where it is difficult to model and solve using other methods and given the number of variables in a singletarget 4D transport model, we will use artificial intelligence algorithms to solve the problem, but before solving we must find a decoding procedure that helps Algorithms in search of good solutions in record time.

Table (1-3) Results of Material Transferred Quantities for Algorithm PSO.

We note that the methods used as the matrix $(1,1)(1,4)(2,4)$ for the quantities of transported materials follow 3 paths because of their appropriate costs, while the rest of the paths were avoided because of their high costs, and the matrix $(2,1)(1,3)$ All paths were avoided due to their high costs, and the matrix $(1,2)(2,2)$ were avoided because of their high costs, except for two paths that were used because of their appropriate cost, either matrix $(2,3)$ five paths were used because of their cost The rest of the paths equal to zero were avoided.

After substituting in equation (1-1), the cost function is obtained, that is, by multiplying the matrices $(1,1)(2,1)(1,2)(2,2)(1,3)(2,3)(1,4)(2,4)$ The cost of transporting one unit $C_{i, j, k, q}$ from the materials corresponding to the matrices $(1,1)(2,1)(1,2)(2,2)(1,3)(2,3)(1,4)(2,4)$ regarding the amount of different transported materials $X_{i, j, k, q}$.
$\operatorname{Min} Z_{1}=$

| supplier 4 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 200 |  | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| supplier 5 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |  | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| supplier 6 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |  | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| supplier 7 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |  | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| supplier 8 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |  | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

The second entry we add each of the matrix $(1,2)(2,2)$ to get $d_{2}=3800$ as shown below:

| 1,2 |  |  |  |  |  |  |  |  | 2,2 |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | demand node 1 | demand node 2 | demand node 3 | demand node 4 | demand node 5 | demand node 6 | demand node 7 | demand node 8 |  | demand node 1 | demand node 2 | demand node 3 | demand node 4 | demand node 5 | demand node 6 | demand node 7 | demand node 8 |
| supplier 1 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |  | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| supplier 2 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |  | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| supplier 3 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |  | 0 | 0 | 0 | 300 | 0 | 0 | 0 | 0 |
| supplier 4 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |  | 0 | 0 | 1500 | 0 | 0 | 0 | 0 | 0 |
| supplier 5 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | + | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| supplier 6 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |  | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| supplier 7 | 1800 | 200 | 0 | 0 | 0 | 0 | 0 | 0 |  | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| supplier 8 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |  | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

The third constraint we add all of the matrix $(1,3)(2,3)$ to get $d_{3}=4200$ as shown below:

| 1,3 |  |  |  |  |  |  |  |  | 2,3 |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | demand node 1 | demand node 2 | demand node 3 | demand node 4 | demand node 5 | demand node 6 | demand node 7 | demand node 8 | + | demand node 1 | demand node 2 | demand node 3 | demand node 4 | demand node 5 | demand node 6 | demand node 7 | demand node 8 |
| supplier 1 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |  | 0 | 0 | 0 | 0 | 0 | 0 | 100 | 0 |
| supplier 2 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |  | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| supplier 3 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |  | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| supplier 4 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |  | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 100 |
| supplier 5 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |  | 0 | 0 | 0 | 0 | 0 | 0 | 2000 | 0 |
| supplier 6 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |  | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| supplier 7 | 0 | 0 | 0 | 0 | 0 | 0 | , | 0 |  | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| supplier 8 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |  | 0 | 0 | 0 | 1800 | 200 | 0 | 0 | 0 |

As for the fourth entry, we add each of the matrix $(1,4)(2,4)$ until we get $d_{4}=4100$ as shown below:

| 1,4 |  |  |  |  |  |  |  |  | 2,4 |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | demand node 1 | demand node 2 | demand node 3 | demand node 4 | demand node 5 | demand node 6 | demand node 7 | demand node 8 | + | demand node 1 | demand node 2 | demand node 3 | demand node 4 | demand node 5 | demand node 6 | demand node 7 | demand node 8 |
| supplier 1 | 0 | 0 | 300 | 400 | 0 | 0 | 0 | 0 |  | 0 | , | 0 | , | 0 | 0 | 0 | 1200 |
| supplier 2 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |  | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| supplier 3 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |  | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| supplier 4 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |  | 0 | 0 | 200 | 0 | 0 | 0 | 0 | 0 |
| supplier 5 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |  | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| supplier 6 | 0 | 1400 | 0 | 0 | 0 | 0 | 0 | 0 |  | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 600 |
| supplier 7 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |  | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| supplier 8 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |  | 0 | 0 | , | 0 | 0 | 0 | 0 | 0 |

Best solution using PSO

| decoding | 13 | 20 | 4 | 14 | 18 | 5 | 11 | 19 | 8 | 1 | 6 | 16 | 3 | 22 | 15 | 12 | 9 | 7 | 21 | 17 | 10 | 2 |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |

The best solution was obtained through the process of combining eight supply centers with eight demand centers, two distribution lines and four means of transportation.

## RESULTS

The results are obtained by MATLAB program.
By solving the four-dimensions transportation model, the lowest cost was obtained $(11316,400)$ dollars through the different distribution lines for the different means of transportation from the different supply centers to the different demand center.

## 5. Conclusions and Perspectives

Different results were achieved using the proposed algorithm of the four-dimensional transportation model with one goal for the data obtained from the Iraqi Ministry of Trade by taking different samples ( 8 supply centers, 8 demand centers, 2 distribution lines, 4 different means of transportation) through the results obtained It is done by MATLAB program and choosing the best solution, among those multiple optimum solutions obtained by means of the decoding procedure. Generalizing the four-dimensional transportation model to all companies that require decisions to reduce transportation costs, whether the different means of transportation through the different distribution line in addition to the different supply and demand centers.

We note that the solution of the four-dimensional transport model with a single goal provides optimal solutions in determining the quantities of homogeneous and heterogeneous materials that will be transported by different means of transport from different sources to different requesting parties at the lowest total cost Generalizing the multi-objective four-dimensional transportation model to all companies that require decisions to reduce transportation costs, times and distance together, whether the different transportation means across the different distribution line in addition to homogeneous or heterogeneous materials.

We recommend the use of the multi-objective four-dimensional transport model by the Iraqi Ministry of Trade when importing homogeneous and heterogeneous materials according to the actual need of the country and the planned quantities of transport using artificial intelligence algorithms.

4D TRANSPORTATION PROBLEM
The future work will be to solve the multi-objective four-dimensional transportation model and generalize it's use to all companies that require decisions to reduce transportation costs, times and distance together, whether the different transportation means across the different distribution line in addition to homogeneous or heterogeneous materials. We also propose to compare several different metaheuristics for solving the problem.

## CONFLICT OF INTERESTS

The authors declare that there is no conflict of interests.
