**Abstract.** In this paper, we will obtain several results concerning the properties of pairwise C-closed spaces and to study the relations of pairwise C-closed spaces with some related pairwise topological properties like pairwise compactness, sequential spaces, pairwise quasi-k spaces and pairwise C-sequential spaces.

**Keywords:** pairwise C-closed spaces; pairwise k-spaces; pairwise quasi-k-spaces; pairwise tightness; sequential; pairwise C-sequential.

**2010 AMS Subject Classification:** 54A05.

### 1. INTRODUCTION

The study of bitopological spaces was first initiated by J. C. Kelly [1] in 1963 and thereafter a large number of papers have been done to generalize the topological concepts to bitopological setting. In this paper, we study the notion of pairwise C-closed spaces in bitopological spaces and their relation with other bitopological concepts. We will show that pairwise countably compact C-closed space has countable tightness and we will introduce characterization of pairwise sequential compact hausdorff spaces. We use  $R$  to denote the set of all real and  $P$ - to denote pairwise,  $Cl$  to denote the closure of a set, and  $t(X)$  to denote the tightness of  $X$ .

## 2. PAIRWISE C-CLOSED SPACE

**Definition 2.1:** [6] A cover  $V$  of the bitopological space  $(X, \tau_1, \tau_2)$  is called pairwise open cover if  $V \in \tau_1 \vee \tau_2$ .

**Definition 2.2:** . A bitopological space  $(x, \tau_1, \tau_2)$  is said to be pairwise countably compact if every countably pairwise open cover of  $X$  has finite subcover.

**Definition 2.3:** [1] A bitobological space  $(x, \tau_1, \tau_2)$  is called pairwise hausdorff if for any tow distinct points  $x, y \in X$ , there exist disjoint  $V_1 \in \tau_1$  and  $V_2 \in \tau_2$  with  $x \in V_1$  and  $y \in V_2$

**Definition 2.4:** [4] In a space  $(x, \tau_1, \tau_2)$ ,  $\tau_1$  is said to be regular with respect to  $\tau_2$  if, for each point  $x \in X$  and each  $\tau_1$ - closed subset  $F$  s.t  $x \notin F$ , there are  $\tau_1$ -open set  $U$  and  $\tau_2$ -open set  $V$  s.t  $x \in U$  and  $F \subset V$  and  $U \cap V = \emptyset$ .  $(x, \tau_1, \tau_2)$  is p- regular if  $\tau_1$  regular with respect to  $\tau_2$  and vise versa.

Reilly [5] proves the following proposition:

**Proposition 2.5:** If  $(X, \tau_1, \tau_2)$  is a bitopological space, the following are equivalent:

- a)  $\tau_1$  is regular with respect to  $\tau_2$
- b) For each point  $x \in X$  and  $\tau_1$ -open set  $U$  containing  $X$ , there is a  $\tau_1$ -open set  $V$  such that  $X \in V \subset \tau_2\text{-cl } V \subset U$

**Definition 2.6:** A bitopological space  $(x, \tau_1, \tau_2)$  is called pairwise C- closed if every  $\tau_1$ -countably compact subset of  $X$  is  $\tau_2$ - closed in  $X$  and every  $\tau_2$ - countably compact subset of  $X$  is  $\tau_1$ - closed in  $X$ .

**Definition 2.7:** Let  $(x, \tau_1, \tau_2)$  be bitoplogical space,  $A \subset X$ , we say that  $x \in X$  is a  $\tau_i$ - cluster point for  $A$ , if for every  $\tau_i$ -open set  $U$  containing  $x$ ,  $U \cap A / \{x\} \neq \emptyset$  i=1,2.

**Definition 2.8:** A bitoplogical space  $(X, \tau_1, \tau_2)$  is called pairwise C-closed if every non  $\tau_1$ -closed subset  $A$  of  $X$  contains a sequence which has no  $\tau_2$ -cluster point in  $A$ ,and every non  $\tau_2$ -closed subset  $B$  of  $X$  contains a sequence which has no  $\tau_1$ -cluster point in  $B$ .

From definition of pairwise C-closed we have:

**Corollary 2.9:** Every subspace of pairwise c-closed is pairwise C-closed.

**Definition 2.10:** A bitopological space  $(x, \tau_1, \tau_2)$  is said to be sequantial if both  $(x, \tau_1)$  and  $(x, \tau_2)$  sequantial, i.e every non  $\tau_1$ - closed subset  $A$  of  $X$  contains a sequance converting to a

point in  $X \setminus A$  and every non  $\tau_2$ -closed subset  $B$  of  $X$  contains a sequence converting to a point in  $X \setminus B$

**Theorem 2.11:** Let  $(X, \tau_1, \tau_2)$  be pairwise Hausdorff space, let  $(x_n)$  be a convergent sequence in  $X$ , then  $(x_n)$  has exactly one limit point.

**Proof:** Suppose the contrary. Then  $x_n \rightarrow x$  and  $x_n \rightarrow y$  for some  $x \neq y$ , there exist disjoint  $U \in \tau_1$  and  $V \in \tau_2$  with  $x \in U$  and  $y \in V$ . Therefore, there exist  $N_U \in \mathbb{N}$  such that  $x_n \in U$  for every  $n > N_U$  and  $N_V \in \mathbb{N}$  such that  $x_n \in V$  for every  $n > N_V$ , choose  $N = \max\{N_U, N_V\}$ . Thus, there exist  $N \in \mathbb{N}$  such that  $x_n \in U, x_n \in V$  for every  $n > N$ .

But  $U \cap V = \emptyset$ , which is the contradiction.

**Proposition 2.12:** Every pairwise Hausdorff sequential space is pairwise C-closed.

**Proof:** let  $A$  be non  $\tau_1$ -closed subset of  $X$ , since  $X$  is sequential, there exist a sequence  $(x_n)$  converting to a point in  $X \setminus A$  say  $x$ , By uniqueness of limit point of the sequence in pairwise hausdorff space, we conclude that  $(x_n)$  has no  $\tau_2$ -cluster point in  $A$ , similarly we can proof that every non  $\tau_2$ -closed subset  $B$  of  $X$  contain sequence has no  $\tau_1$ -cluster point in  $B$ .

Hence the result.

**Proposition 2.13:** If  $X$  is pairwise Hausdorff and every pairwise countably compact subset of  $X$  is sequential then  $X$  is pairwise C- closed.

**Proof:** let  $A$  be  $\tau_1$ -countably compact subset of  $X$  and suppose that  $A$  is not  $\tau_2$ -closed in  $X$ , then there exist  $x \in \tau_2\text{-Cl } A \setminus A$ , let  $B = A \cup \{x\}$ , then  $B$  is also  $\tau_1$ -countably compact, now  $A$  is not  $\tau_2$ -closed in  $B$ , Since  $B$  is sequential then there exist sequence  $x_n$  in  $A$  s.t  $x_n \rightarrow B \setminus A = \{x\}$ . Therefore there exist seq  $x_n$  in  $A$  has no  $\tau_1$ -cluster point in  $A$ , this is contradiction.

Note that every pairwise countably compact subset of a bitopological space  $X$  may be sequential and  $X$  may still be not sequential. such is, the following example:

**Example 2.14:** The space of all continuous real valued function on the interval  $[0,1]$  and generalize example [7] by letting  $\tau_1 = \tau_2 =$  the point wise convergence topology.

**Definition 2.15:** [2] A map  $f: X \rightarrow Y$  from bitopological space  $(X, \tau_1, \tau_2)$  to another bitopological space  $(Y, \sigma_1, \sigma_2)$  is called pairwise continuous if  $f$  is continuous both as a map from  $(X, \tau_1)$  to  $(Y, \sigma_1)$  and as a map from  $(X, \tau_2)$  to  $(Y, \sigma_2)$ .

**Proposition 2.16:** Let  $f: (X, \tau_1, \tau_2) \rightarrow (Y, \sigma_1, \sigma_2)$  be a pairwise continuous one - to - one function, if  $(X, \tau_1, \tau_2)$  is pairwise hausdroff space and  $(Y, \sigma_1, \sigma_2)$  is pairwise C-closed, then  $(X, \tau_1, \tau_2)$  is pairwise C-closed.

**Proof:** Let  $f: (X, \tau_1, \tau_2) \rightarrow (Y, \sigma_1, \sigma_2)$  be pairwise continuous and one- to - one map, then  $f: (X, \tau_1) \rightarrow (Y, \sigma_1)$  and  $f: (X, \tau_2) \rightarrow (Y, \sigma_2)$  are both continuous, let  $A$  be  $\tau_1$ -countably compact subset of  $X$ , then  $f(A)$  is  $\sigma_1$ -countably compact subset of  $Y$ , but  $Y$  is pairwise C-closed, thus  $f(A)$  is  $\sigma_2$ -closed subset of  $Y$ , since  $f$  is pairwise continuous and one- to - one map, we get  $f^{-1}(f(A)) = A$  is  $\tau_2$ -closed subset of  $X$ . similarly we can prove that if  $A$  is  $\tau_2$ -countably compact subset of  $X$  then  $A$  is  $\tau_1$ -closed subset of  $X$ , this completes the proof.

**Corollary 2.17:** In a bitobological space  $(x, \tau_1, \tau_2)$ , if  $X$  has a weaker bitoplogical space which is pairwise C-closed, then  $X$  is is pairwise C-closed.

**Proposition 2.18:** Let  $X$  be a pairwise regular space and every point has a pairwise C-closed neighbourhood, then  $X$  is pairwise C-closed.

**Proof:** Let  $A$  be  $\tau_1$ -countably cocompact subset of  $X$  and  $x \in \tau_2\text{-cl}(A)$ , wont to show that  $x \in A$ , let  $U$  be a  $\tau_2$ - open set containing  $x$  and  $U$  is pairwise C-closed,then by p- regularity there is a  $\tau_2$ -open set  $V$  such that  $x \in V \subset \tau_1\text{-cl}(V) \subset U$ . since  $A$  is  $\tau_1$ - countably compact, then  $\tau_1\text{-cl}(V) \cap A$  is also  $\tau_1$ -countably compact subset of  $U$ ,hence it is  $\tau_2$ -closed subset of  $U$ . But  $x \in \tau_2\text{-cl}(\tau_1\text{-cl}(V) \cap A) = \tau_1\text{-cl}(V) \cap A$ , hence  $x \in A$ ,therefore  $A$  is  $\tau_2$ -closed subset of  $X$ . similarly, we can prove that if  $A$  is  $\tau_2$ -countably compact subset of  $X$ , then  $A$  is  $\tau_1$ -closed subset of  $A$ ,this complete the proof.

**Definition 2.18:** [3] The tightness of  $x$   $t(X)$  denoted by the smallest cardinal numbers  $\Gamma$  s.that whenever  $A \subset X$  and  $x \in \overline{A}$ ,then there is a subset  $B$  of  $A$  so that  $|B| \leq \Gamma$  and  $x \in \overline{B}$ .

**Definition 2.19:** A bitopological space  $(x, \tau_1, \tau_2)$  is said to have a pairwise countable tightness property if it has  $\tau_1$ -countable tightness and  $\tau_2$ -countable tightness property.

**Definition 2.20:** A subset  $A$  of bitopological space  $(x, \tau_1, \tau_2)$  is called pairwise k- closed if for every pairwise compact subset  $K$  of  $X$ ,  $A \cap K$  is  $\tau_1$ - closed ( $\tau_2$  - closed) in  $K$ .

**Definition 2.21:** A subset  $A$  of bitopological space is called pairwise quasi k- closed if for every pairwise countably compact subset  $K$  of  $X$ ,  $A \cap K$  is  $\tau_1$ - closed( $\tau_2$  - closed) in  $K$ .

**Definition 2. 22:** A bitopological space  $(x, \tau_1, \tau_2)$  is said to be pairwise k- space if every  $\tau_1$ -k-closed ( $\tau_2$ - k-closed) subset of  $X$  is  $\tau_1$ -closed ( $\tau_2$ - closed) in  $X$ .

**Example 2.23:** Consider  $(R, \tau_1, \tau_2)$  where  $\tau_1$  is the discrete topology and  $\tau_2 = \{U \subset R : 0 \notin U\} \cup \{R\}$ , then  $(R, \tau_1, \tau_2)$  is a a pairwise-k space.

**Definition 2.24:** A bitopological space  $(x, \tau_1, \tau_2)$  is said to be pairwise quasi- k- space if every  $\tau_1$ -quasi- k-closed ( $\tau_2$ -quasi- k-closed) subset of  $X$  is  $\tau_1$ -closed ( $\tau_2$ - closed) in  $X$ .

**Proposition 2.25:** If  $X$  is a pairwise hausdorff, pairwise quasi -k and (in particular pairwise countably compact or pairwise k ) and pairwise C-closed space, then  $t(X) \leq \omega_0$ .

**Proof:** Let

$A \subset X$   $Y = \cup \{\tau_1\text{-cl}(B) : B \subset A \text{ and } |B| \leq \omega_0\}$  and  $Z = \cup \{\tau_2\text{-cl}(F) : F \subset A \text{ and } |F| \leq \omega_0\}$ . wont to show that  $\tau_1\text{-cl}(A) = Y$  and  $\tau_2\text{-cl}(B) = Z$ . now  $A \subseteq Y \subseteq \tau_1\text{-cl}(A)$  and  $A \subseteq Z \subseteq \tau_2\text{-cl}(A)$ , we need to show that  $Y$  is  $\tau_1$ -closed in  $X$  and  $Z$  is is  $\tau_2$ -closed in  $X$ . assume the contrary that  $Y$  is not  $\tau_1$ -closed in  $X$  or  $Z$  is not  $\tau_2$ -closed in  $X$ . if  $Y$  is not  $\tau_1$ -closed in  $X$ , then  $Y$  is not quasi-k-closed in  $X$ , i.e there is pairwise coutably compact subset  $K$  of  $X$  s.that  $K \cap Y$  is not  $\tau_1$ -closed in  $K$ . since  $K$  is pairwise C-closed, then  $K \cap Y$  is not  $\tau_2$ - countably compact, i.e there is a sequnce  $x_n$  in  $K \cap Y$  which has no cluster point in  $K \cap Y$ ,but  $K$  is pairwise countably compact, hence  $x_n$  must have cluster point in  $K$  say  $x$ , therefore  $x \notin Y$ . now for every  $n$  choose  $B_n \subseteq A$  s.that  $B_n$  is countable and  $x_n \in \tau_1\text{-cl}(B_n)$  and let  $B = \bigcup_{n=1}^{\infty} B_n$ , then  $x \in \tau_1\text{-cl}(B)$ , but  $\tau_1\text{-cl}(B) \subseteq Y$ , thus  $x \in Y$ , this is a contradiction.

The assumption of quasi-k space in the above propsition is very importent to get the result, the following example shows this:

**Example 2.26:** Let  $(X, \tau_1, \tau_2)$  be topological space, where  $X = Y \cup \{x\}$ , where  $\tau_1$  consist of  $Y$  which is discrete space of cardinality  $\omega_1$  and  $x$  has countable neighborhoods and  $\tau_2$  has discrete topology, then every  $\tau_1$ - countably compact subset of  $X$  is finite, therefore it is  $\tau_2$ -closed, and every  $\tau_2$ -countably compact subset of  $X$  is finite and hence it is  $\tau_1$ -closed subset of  $X$ , therefore  $X$  is pairwise C-closed space, but  $t(X) = \omega_1$

**Definition 2.27:** Let  $(x, \tau_1, \tau_2)$  be a bitopological space, let  $A \subset X$ , then  $x$  is called  $\tau_i$ -isolated point of  $A$  if there exist open set  $U \in \tau_i$  s.that  $U \cap A = \{x\}$ ,  $i = 1,2$ .

**Definition 2.28:** A bitopological space  $(x, \tau_1, \tau_2)$  is said to be (*C*-sequantial) if for every  $\tau_1$ -closed ( $\tau_2$ -closed) subset  $A$  of  $X$  and for every non  $\tau_1$ -isolated (non  $\tau_2$ -isolated) point  $x$  of  $A$ , there is a sequence  $x_n$  in  $A / \{x\}$  converging to  $x$ .

**Proposition 2.29:** If  $X$  is pairwise Hausdorff, pairwise quasi-  $k$  and pairwise  $C$ -closed, then  $X$  is pairwise  $C$ -sequential.

**Proof:** since every  $P$ - closed subset of  $X$  is pairwise quasi- $K$  and pairwise  $C$ -closed, it is enough to show that if  $x$  is not  $\tau_1$ -isolated(not  $\tau_2$ -isolated) point in  $X$ , then there is a sequence in  $X / \{x\}$  converging to  $x$ . if  $x$  is not  $\tau_1$ -isolated point of  $X$ , then  $U \cap X \neq \{x\}$  for every  $U \in \tau_1$  and hence  $X / \{x\}$  is not  $\tau_1$ -closed in  $X$ . similarly, if  $x$  is not  $\tau_2$ - isolated point in  $X$ , then  $V \cap A \neq \{x\}$  for every  $V \in \tau_2$  and hence  $X / \{x\}$  is not  $\tau_2$ -closed in  $X$ . If  $X / \{x\}$  is not  $\tau_1$ -closed in  $X$ , then there is  $\tau_1$ - countably compact subset  $K$  of  $X$  S.that  $K / \{x\}$  is not  $\tau_1$ -closed in  $K$ . since  $K$  is  $C$ -closed,  $K / \{x\}$  is not  $\tau_1$ -closed in  $K$ , then there is a sequence  $x_n$  in  $K / \{x\}$  which has no  $\tau_2$ -cluster point in  $K / \{x\}$ , Therefore  $x_n \rightarrow x$ . similarly, if  $X / \{x\}$  is not  $\tau_2$ -closed in  $X$ , we get  $x_n \rightarrow x$ . This complete the proof.

**Definition 2.30:** A bitopological space  $(x, \tau_1, \tau_2)$  is said to be sequentially compact with respect to  $\tau_i$  if every infinite sequence has convergent subsequence with respect to  $\tau_i$ ,i.e for every sequence  $\{x_n : n \in w\}$  and for every  $\tau_i$ -open  $nhd$   $U$  of  $x$  s.that  $x_n \in U$  whenever  $n \geq m$  for some  $m$ , there exist subsequence  $\{x_{n_k} : k \in w\}$  of  $x_n$  s. that  $x_{n_k} \in U$  whenever  $k \geq m$ .  $i = 1, 2$ .

**Definition 2.31:** A bitopological space space  $(x, \tau_1, \tau_2)$  is said to be pairwise sequentially compact if it is sequentially compact with respect to  $\tau_1$  and sequentially compact with respect to  $\tau_2$ .

**Proposition 2.32:** A pairwise sequentially compact Hausdorff space  $X$  is pairwise sequential iff it is pairwise  $C$ -closed.

**Proof:**  $(\Rightarrow)$  it is obvious from Corollary 2. 12  $(\Leftarrow)$  let  $A$  be non  $\tau_1$ -closed subset of  $X$ , then there is a sequence  $x_n$  in  $A$  which has no  $\tau_2$ -cluster point in  $A$ , but  $X$  is pairwise seuantially compact, thus  $x_n$  has convergent subsequence  $x_{n_K}$  with respect to  $\tau_2$  say to  $x \in X$ , since  $x_{n_K}$  has no  $\tau_2$ -cluster point in  $A$ , then  $x \in X / A$ , therefore there is a sequence in  $A$  converting to a point in  $X / A$ . we get  $(X, \tau_1)$  is sequantial.  $(1)$  similarly, if  $B$  is non  $\tau_2$ -closed subset of  $X$ , then there is a sequence  $x_m$  in  $B$  which has no  $\tau_1$ -cluster point in  $B$ , since  $X$  is pairwise seuantially

compact,  $x_m$  has convergent subsequence  $x_{m_L}$  with respect to  $\tau_1$  say to  $y \in X$ , but  $x_{m_L}$  has no  $\tau_1$ -cluster point in  $A$ , hence  $y \in X / B$  and  $(X, \tau_2)$  is sequential. (2) from 1 and 2, we get  $X$  is pairwise sequential.
